# Summary of Present Research Work

Synthesis of mesoporous  $SnO_2$  nanoparticles  $(SnO_2 \ NPs)$ , nanostructure  $Fe_3O_4$  and supported metal/non-metal  $(Au/Fe_3O_4, SiO_2/Fe_3O_4, CeO_2/Fe_3O_4, AC/Fe_3O_4)$  and  $Au/SiO_2$ ,  $Au/\gamma-Al_2O_3$ , Au/AC,  $Au/TiO_2$  and these were confirmed by various physico-chemical characterization techniques such as XRD, TEM, SEM, XPS, FT-IR, and BET surface area, UV-visible spectroscopy. These catalysts and photo-catalysts are used in various industrial applications like degradation of dyes, pesticides and volatile organic compounds (VOCs).

# Summary of Postdoctoral Research Work

In my post-doctoral work, I have synthesized a bimetal electro-catalyst synthesized by Co and Ag metals to investigate the effect of the bimetal over gas phase CO<sub>2</sub> electrochemical reduction. Electrochemical reduction of carbon dioxide to fuel is one of the most promising and challenging techniques but requires significant energy input. Various metals, metal oxides, and metal complexes have been studied to increase the Faradic efficiency, selectivity, and to reduce the energy input for the generation of hydrocarbons. However, bimetallic electro-catalysts are hardly evaluated for the electrochemical reduction of CO<sub>2</sub> in spite of the proven synergetic effect of bimetals for various chemical reactions. Therefore, the present study investigates the role of bimetallic electro-catalysts in the CO<sub>2</sub> electrochemical reduction. It is found that though the chosen metals are individually selective for the CO formation the combination results in CH<sub>4</sub> and C<sub>2</sub>H<sub>4</sub> formation along with CO. The maximum Faradic efficiency for CH<sub>4</sub> is 19.5% at 2V using Co-Ag.

# Summary of Doctoral Research Work

Catalyzed oxidation of aromatic hydrocarbons with molecular oxygen has been studied for several decades. For example, toluene can be converted into oxidation products such as benzyl alcohol, benzaldehyde, benzoic acid and benzyl benzoate. At present, the principal industrial production of benzoic acid via the oxidation of toluene involves the use of homogeneous cobalt catalysts in an air pressurized aqueous acetic acid mixture in the presence of Mn ions. However, the use of solvent causes difficulties in the separation of catalysts and products, equipment corrosion, and due to the environmental hazards associated with the use of liquid acids as solvent. Developing solvent free benzyl alcohol oxidation having great activity has attracted special attention as a promising environmentally friendly reaction.

In my Ph.D. work, I have synthesized nano gold catalysts supported on various supports like mesoporous materials (SBA-15, MCM-41, TiO<sub>2</sub>) and commercial supports (activated carbon, SiO<sub>2</sub> and  $\gamma$ -Al<sub>2</sub>O<sub>3</sub>). The catalysts were characterised for their physico-chemical properties using X-ray diffraction (XRD), transmission electron microscopy (TEM), BET surface area, pore size distribution (PSD), CO-chemisorption, temperature programmed reduction (TPR)/desorption (TPD) and X-ray photoelectron spectroscopy (XPS) techniques. The catalytic activity and stability of the various supported nano gold catalysts are investigated during the vapor phase aerobic oxidation of benzyl alcohol to benzaldehyde and investigated the following parameters: (i) the quantitative influence of particle composition; (ii) the role of particle size; (iii) the influence of the supports; (iv) influence of metal loading; (v) correlation of catalytic functionalities with surface structural properties; (vi) deactivation of the catalysts during the reaction.
